

Our Configurator Family is Growing!

The Owners of Heat and Sensor Technology have had a particular long-time vision – to implement premier technology with our Configurator programs. Our goal began using DriveWorks software to design Configurator programs – for building heaters... online, and especially for use by Distributors and OEM businesses.

We began to realize this dream in May of 2014, with the launch of our Thinband Stock Configurator, and our Thinband Custom Configurator. And before the year closed, we launched our Channel Strip Configurator (November, 2014). Keeping up our momentum, in February of 2015, we launched our Cartridge Configurator. What's next? The Mica Strip Configurator will be next... and just in time for the NPE2015 show!

We feel our Configurators are a benchmark of achievement – representing excellence in customer service that we'll continue to develop. Our customers have convenient access when they want to build a heater, 24/7 – right from our Home page. The appealing benefits of our programs are: Customers can manipulate and examine the 3-D image of their design – before placing an order. And once a customer completes their design, and clicks the quote button, they automatically receive an emailed quote and drawing of their built heater.

If you too would like to test a Configurator, please don't hesitate to call us: EST, 8-5 pm: 513-228-0481, for your personal USER & PASS access codes.
